Internet traffic growth: A gale or a hurricane?

Andrew Odlyzko

Broadband mantras:

You can never have too much bandwidth.
If you build it, they will come.

Key question for the industry: How quickly will they come?

Answer: Not as quickly as many hope.
Popular myth of astronomical growth rates:

“Internet traffic is doubling every three months.”

Business Week, Oct. 9, 2000

“In 1999, data traffic was doubling every 90 days …”

Reed Hundt (former chairman, FCC)

You Say You Want a Revolution

Yale Univ. Press, 2000

But never any hard data to support these claims!
The myth and the reality:

“[LINX] traffic doubles every hundred days or so.”

But,

LINX traffic, March 1999 to March 2000

LINX statistics show traffic taking more than 200 days to double during this period!
General conclusion: Internet traffic about doubles each year, not each 3 and 4 months

Backbone traffic growth: about 100% per year in 1990 through 1994
about 1,000% per year in 1995 and 1996
about 100% per year in 1997 through 2000

Overall data traffic growth: around 20 to 30% per year in the 1980s
30 to 40% per year in 1990 through 1998
accelerating towards 100% per year
A new form of “Moore’s Law:” data traffic at large institutions tends to double each year, with great regularity.

Example: incoming traffic to Merit network

<table>
<thead>
<tr>
<th>date</th>
<th>millions of packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jan 1993</td>
<td>1115.7</td>
</tr>
<tr>
<td>Jan 1994</td>
<td>3047.3</td>
</tr>
<tr>
<td>Jan 1995</td>
<td>5284.8</td>
</tr>
<tr>
<td>Jan 1996</td>
<td>18515.9</td>
</tr>
<tr>
<td>Jan 1997</td>
<td>30319.5</td>
</tr>
<tr>
<td>Jan 1998</td>
<td>50024.7</td>
</tr>
</tbody>
</table>

“Doubling” is used in a loose sense, to cover rates of growth between 70% and 150%. This is rapid growth, much more rapid than in wired or wireless voice or traditional data, but not the astronomical 700% to 1,500% growth rates that a doubling of traffic every 3 or 4 months implies!
Traffic from the Internet to the University of Waterloo

![Graph showing the decimal log of bits per second from 1993 to 2000.](chart.png)
Doubling of traffic each year is disruptive:

A 25-year IRU is really good only for 2 or 3 years

Filling the pipes is the main imperative

Careful traffic planning impossible

...
Internet Traffic at the University of Waterloo

![Graph showing the percentage of traffic from different sources (Web, ftp, other, email) over the years 1994 to 2000. The graph indicates a significant increase in Web traffic from 1994 to 1998, followed by a decline in recent years. FTP and other traffic show a steady decline, while email traffic remains relatively constant.]
Napster, just like WWW, is another disruptive phenomenon that helps sustain the growth of traffic:
The effect of Napster at the University of Wisconsin in Madison
Traffic is not the same as bandwidth

Factors decreasing bandwidth demand:
- Elimination of SONET rings, ATM “cell tax,” etc.
- VPNs over public network replacing private lines

Factors increasing bandwidth demand:
- Optical switching
- Demand for low transaction latency

Average utilization of LANs during the 1990s appears to have decreased by a factor of 10.

There is no fixed lower bound on average utilization.
DWDM is doubling transmission capacity of fiber each year, but magnetic storage is also doubling each year!

Worldwide hard disk drive market. (Based on Sept. 1998 and Aug. 2000 IDC reports.)

<table>
<thead>
<tr>
<th>year</th>
<th>storage capacity (terabytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1995</td>
<td>76,243</td>
</tr>
<tr>
<td>1996</td>
<td>147,200</td>
</tr>
<tr>
<td>1997</td>
<td>334,791</td>
</tr>
<tr>
<td>1998</td>
<td>695,140</td>
</tr>

<td>2001</td>
<td>7,239,972</td>
</tr>
<tr>
<td>2002</td>
<td>15,424,824</td>
</tr>
<tr>
<td>2003</td>
<td>30,239,756</td>
</tr>
<tr>
<td>2004</td>
<td>56,558,700</td>
</tr>
</tbody>
</table>

⇒ locality of traffic will still matter!
Conclusions:

“Internet traffic doubling every three months” is a fable -- there is about one doubling each year

Doubling each year is extremely high and disruptive growth

The regular growth rate comes from interaction of technology, economics, and sociology ⇒ another “Moore’s Law”

Transmission capacity is growing at about the same rate as traffic ⇒ rough balance between supply and demand

Magnetic storage is doubling each year ⇒ the predominance of storage over transmission will continue

Streaming media traffic is likely to be a small factor; local store and replay will dominate
More details in papers at

especially “Internet growth: Is there a ‘Moore’s Laws’ for data traffic” (with Kerry Coffman)
